34.5/115 kV Solar Power Plant & Substation Senior Design Project

Senior Design Team 18 - May 2024

Siti Mohd Radzi, Baylor Clark, Eduardo Jimenez-Tzompaxtle, Chicheng Tang, Eli Schaffer, Liam Gossman

Agenda

- Safety Moment
- Calculation Documents
- AutoCAD Update
- ETAP
- Feedback

Safety Moment - Safe lifting techniques

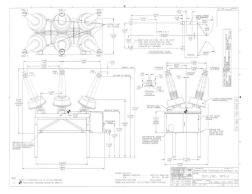

- Back injuries are one of the five main types of workplace injuries, and 75% of workplace-related back injuries occur during a lifting task.
- To avoid back injuries, safe lifting techniques required.
 - Holding the load as close to body as possible, level with belly button.
 - Keeping shoulders in line with hips as move (don't twist your trunk).
 - Changing direction with feet and leading with hips.
 - Taking small steps and keeping a good grip with all fingers.
- To set down the heavy objects
 - Keep the load close to body and back straight or slightly arched.
 - Squat down, bending only at the knees and hips.
 - Tight stomach muscles when lower yourself.
 - Kneel on one knee if necessary.

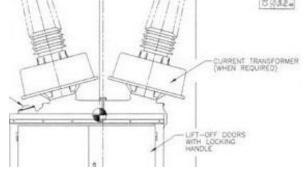

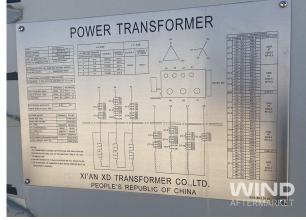

https://www.thepromove.com/news/blog/proper-lifting-techniques-used-by-professional-movers

High Side Breaker CTs

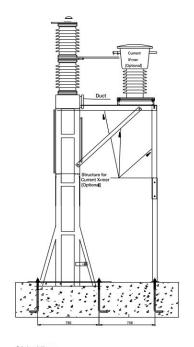

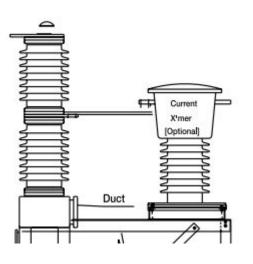

6 CTs, 1 per phase on each side of the breaker

XFMR also has 12 available CTs

Image Lin

Low Side Breaker CTs

Changed low side breaker to SF6 model from vacuum model

Assuming 3 CTs, 1 per phase on one side of the breaker

Side View

Relays

Changed SEL-451 to SEL-352

Intended to use SEL-451 as a breaker protection relay, however SEL-352 is specifically designed for this purpose and will require fewer instrument transformer connections (352 is also slightly cheaper).

This will fit better with our low side breakers (assuming 3 CTs per low side breaker)

Note: This will require some DC and cost recalculations, however the differences should be small enough to avoid any changes to battery calculations

https://selinc.com/products/352/

Calculations

Battery Charger Equation:

$$A = L + \frac{AHR * K}{T}$$

A = Battery charger output current (A)

L = Continuous load current (A)

AHR = Amp hours removed of the battery system (Ah)

K = Efficiency factor (1.15 for flooded lead acid, 1.4 for NiCa)

T = Recharge time (hours)

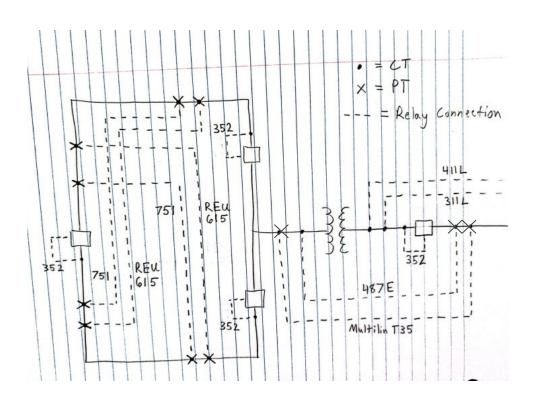

Our system has a 100 Ah capacity with 60 Ah removed, and uses flooded lead acid batteries. Our continuous load is 3.576 A. Typical recharge times are usually 8, 12, or 24 hours.

A recharge time of 8 hours results in a charger output of 12.201 A.

A recharge time of 12 hours results in a charger output of 9.326 A.

A recharge time of 24 hours results in a charger output of 6.451 A.

Relay Setup

High side: 5 sets of CTs

Low side: 13 sets of CTs 8 sets of PTs

Calculations - BOM

AutoCAD - Grounding

We have rods = total length/length each = 765 after recalculations

SDMAY23-27 had 315 grounding rods

$$R_g = \frac{R_1 R_2 - R_m^2}{R_1 + R_2 - 2R_m}$$

Mutual ground resistance between the grid and the rod bed

$$R_m = \frac{\rho}{\pi L_c} \left[\ln \left(\frac{2L_c}{L_r} \right) + \frac{k_1 \cdot L_c}{\sqrt{A}} - k_2 + 1 \right]$$

$$R_1 = \frac{\rho}{\pi L_c} \left[\ln \left(\frac{2L_c}{a'} \right) + \frac{k_1 \cdot L_c}{\sqrt{A}} - k_2 \right]$$

where

is the soil resistivity in Ω·m

is the total length of all connected grid conductors in m

is $\sqrt{a \cdot 2h}$ for conductors buried at depth h in m, or

is a for conductor on earth surface in m

is the diameter of conductor in m

is the area covered by conductors in m²

are the coefficients [see Figure 25(a) and (b)]

(53)

$$R_{2} = \frac{\rho}{2\pi n_{R} L_{R}} \left[\ln \left(\frac{4L_{R}}{b} \right) - 1 + \frac{2k_{1} \cdot L_{r}}{\sqrt{A}} (\sqrt{n_{R}} - 1)^{2} \right]$$

where

is the length of each rod in m

is the diameter of rod in m 2b

number of rods placed in area A

R2= nR=

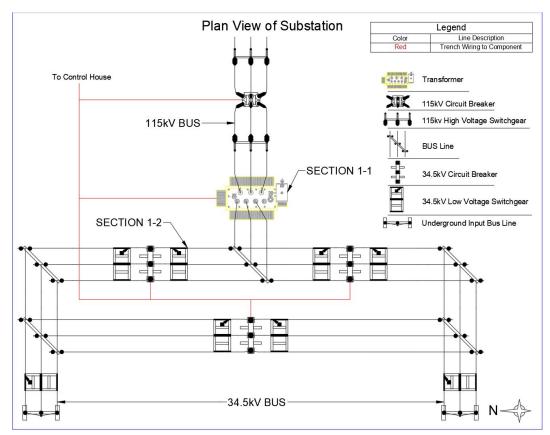

where

ground resistance of grid conductors in Ω

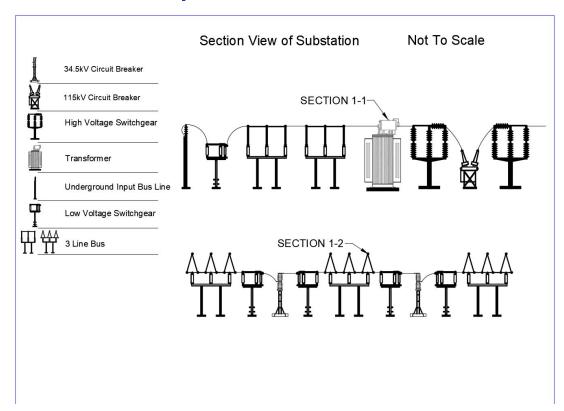

ground resistance of all ground rods in Ω

mutual ground resistance between the group of grid conductors, R_1 , and group of ground rods, R_2 in Ω.
